

Applications guides | Headphones

for the acoustic components

It is used for emitting music, song or speech voice.

Headphones are a pair of small loudspeakers which are designed to be held in place close to a user's ears. Headphones have wires which allow them to be connected to a signal source such as a portable media player. They are also known as stereo phones. The in-ear versions are known as earphones or ear buds.

Cordless headphones are not connected via a wire, receiving a signal encoded using a transmission link, like Bluetooth or Wi-Fi. These are powered receiver systems of which the headphone is only a component. Cordless headphones are used with events such as a Silent disco.

Suggested Item	23C	27C	27D
Size(LxWxH) (mm)	Ø 22.8 x 4.6	Ø 26.8 x 8	Ø 26.8 x 5.7
Sensitivity (dB)	119	118	110
Impedance(Ω)	32	100	300
