

Applications guides | Modern Toilet

for the acoustic components

A signal sound is emitted when button is pressed.

The modern toilet is one of the most advanced types of toilet worldwide, showing a dazzling array of features. As of 2002, almost half of all private homes in Japan have such a toilet, exceeding the number of households with a personal computer. While the toilet looks like a Western-style toilet at first glance, there are numerous additional features—such as blow dryer, seat heating, massage options, water jet adjustments, automatic lid opening, automatic flushing, wireless control panel, room heating and air conditioning for the room—included either as part of the toilet or in the seat. These features can be accessed by an (often wireless) control panel attached to the seat or mounted on a nearby wall.
